## SOME LOCAL NAMES OF PLANTS-2\*

By W. L. MCATEE

Most of the local names recorded for the 82 chiefly specific groups of plants herein listed are not given in botanical manuals and standard glossaries. The few among them that are so included are repeated for definite purposes. As in the previous list localities for all of the names are given.

The citation of places where used adds immensely to the interest and value of a catalog of local cognomens. Among such nicknames some are quaint or amusing, but some also are extremely apt. It would be well were many notoriously bookish names discarded for some of those actually in vernacular use. Among those in the following list, that of patches for *Meibomia*, pickle grass for *Salicornia*, and slink-weed for *Juniperus horizontalis* are particularly fitting.

It is patent that single vernacular names sometimes are applied to more than one botanical species. It is interesting therefore to note that they also err at times in making too fine distinctions. For instance, on Revels Id., Va., the staminate plant of *Baccharis halimifolia* is known as salt water bush, and the pistillate plants with their copious pappus as kinks bushes, and they are regarded as distinct kinds. Again on Matinicus Island, Me., a plant of *Polygonum persicaria* that has dark blotches on the centers of the leaves is heart's-ease, and is recognized in the local pharmacopeia; if the plant does not have dark blotches, then it is not heart's-ease.†

<sup>\*</sup> No. 1 of this series was published in Torreya 13: 225-236. 1913.

<sup>†</sup> I might add that on this island I heard the fungoid malformation of trees, known as witches' broom, called hoorah's-nest.

<sup>[</sup>No. 10, Vol. 16 of Torreya, comprising pp. 211-234, was issued 16 Nov., 1916.] 235

Opportunity for learning the following names came during field work for the U. S. Biological Survey. On a trip for the same office, Mr. C. P. Alexander paid some attention to local plant nomenclature and his results also are incorporated in the following text. The list is indexed so that it may be used as an appendix to other glossaries.

## SHORTER NOTES

Allium platyphyllum sp. nov.—Plant 15 cm. high or more; bulb subglobose, the outer coat somewhat reticulate; leaves 2 or 4, flat, about 20 cm. long, I-I.3 cm. wide, falcate; scapes solitary or in twos, IO-I2 cm. long, compressed, winged; bracts 2, ovate, membranous; flowers numerous, rose-purple, borne on slightly winged pedicels about 15 mm. long; perianth segments oblong-ovate, acuminate, I0 mm. long or less; filaments included, membranous, dilated at the base; fruit not seen.

Type in the U. S. National Herbarium (Frederick V. Coville, no. 2362) collected on steep scab-land in the Valley of Peavine Creek on the trail from Chico to Billy Meadows, Wallowa National Forest, Oregon, at an elevation of about 1,200 meters.

This species is readily recognized by its broad, falcate leaves, its compressed winged scapes, the latter appearing singly or in
